

McDaniel Energy LLC

Preliminary Mineral & Prospect Package

McDaniel Energy LLC is an early-stage independent energy company focused on evaluating conventional oil and natural gas opportunities within the Appalachian Basin region of Southern Ohio. This preliminary prospect package summarizes publicly available geological and historical exploration information associated with acreage located within the Pike County / Adams County regional trend.

Property Overview

The subject acreage is located within the Pike County and Adams County region of Southern Ohio, an area with documented historical oil and gas exploration activity. Historical well records reviewed through the Ohio Department of Natural Resources indicate repeated exploratory drilling activity targeting formations including the Berea Sandstone, Ohio Shale, Lockport Dolomite, Trenton intervals, and St. Peter Sandstone.

Mineral Rights

McDaniel Energy LLC currently controls mineral rights associated with approximately six (6) acres of property located within the evaluated regional area. Additional title review and legal verification are recommended prior to any future operational activity, lease negotiations, or development planning.

Historical Exploration Activity

Multiple nearby wells and exploratory records indicate that the surrounding regional area received significant historical geological attention. Reviewed records include exploratory wells drilled between the 1930s and 1970s, with several wells documenting hydrocarbon shows, geological core work, and deep formation testing. One notable historical exploratory well, identified as the TIRA THOMAS #1 well in Adams County, reached approximately 2,162 feet and documented reported oil barrel shows and hydrocarbon indicators during drilling operations.

Targeted Geological Formations

Historical records indicate repeated evaluation of the following formations within the regional area: • Berea Sandstone • Ohio Shale • Lockport Dolomite • Trenton Intervals • St. Peter Sandstone These formations are historically associated with Appalachian Basin conventional oil and gas exploration activity.

Nearby Wells & Geological Indicators

Reviewed well summaries indicate the presence of multiple plugged and abandoned exploratory wells within the surrounding area. Historical drilling records reference: • Oil barrel shows • Sulfur water indications • Core analysis

activity • Geological logging activity • Repeated formation testing Although these records suggest historical hydrocarbon interest, no representation is made regarding current commercial production potential, reserve estimates, or economic viability.

Opportunity Summary

The evaluated acreage appears to lie within a historically explored Appalachian Basin trend area with documented exploratory drilling activity and hydrocarbon indications. McDaniel Energy LLC is continuing to evaluate the long-term development potential of the acreage through historical research, geological review, and regional operational analysis. Potential future opportunities may include: • Mineral leasing • Joint venture partnerships • Conventional redevelopment evaluation • Geological review by independent operators • Strategic acreage expansion

Important Disclaimer

This document is intended solely for preliminary informational and discussion purposes. No representation or warranty is made regarding the existence of commercially recoverable oil or gas reserves, future production, economic performance, or drilling success. Any future operational activity would remain subject to legal review, title verification, geological analysis, engineering evaluation, permitting, financing, and applicable regulatory approvals.
